

Vector fitting for estimation of turbine governor parameters

Sigurd Hofsmo Jakobsen

Department of electric power engineering

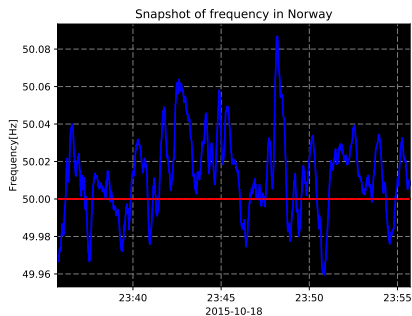

March 22, 2017

Outline

1 Background

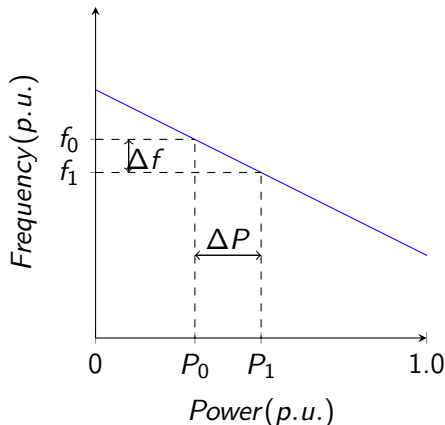

Frequency quality

- There are concerns about the frequency quality in the Nordic countries

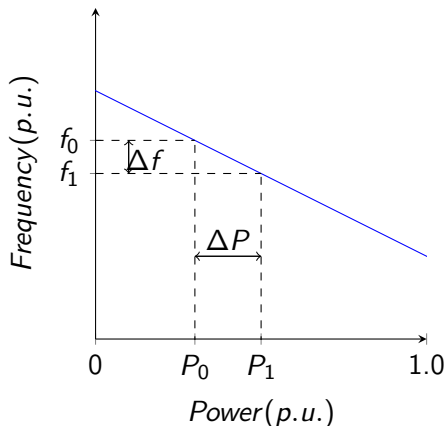

Frequency quality

- There are concerns about the frequency quality in the Nordic countries
- To prevent large deviations in frequency generators participate in frequency containment control (FCR)

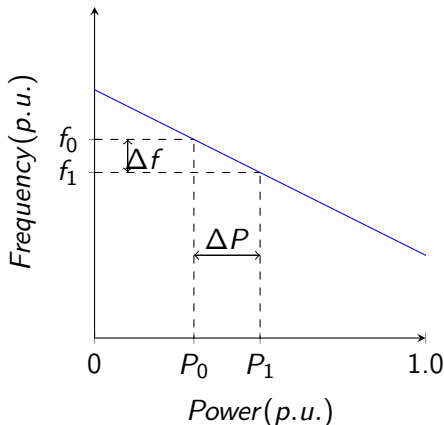

Frequency quality

- There are concerns about the frequency quality in the Nordic countries
- To prevent large deviations in frequency generators participate in frequency containment control (FCR)
- FCR is sometimes referred to as primary control

Frequency quality

- There are concerns about the frequency quality in the Nordic countries
- To prevent large deviations in frequency generators participate in frequency containment control (FCR)
- FCR is sometimes referred to as primary control
- Generators of a certain size have to contribute to this control

Frequency quality

- There are concerns about the frequency quality in the Nordic countries
- To prevent large deviations in frequency generators participate in frequency containment control (FCR)
- FCR is sometimes referred to as primary control
- Generators of a certain size have to contribute to this control
- It is of interest to monitor the generators' FCR performance with respect to both gain and bandwidth
