Version control for researchers

Sigurd Hofsmo Jakobsen

Department of electric power engineering

October 7, 2016

Outline

Introduction to version control

Git

Example using git

Git work flow

Continuous integration

References

A basic example

- Only one person can work on a file at a time

Name

experiment.m

experiment_better_version.m

experiment_final.m

experiment_final_final_20161007...

experiment_maybe_better_2016...

A basic example

- Only one person can work on a file at a time
- Difficult to keep track on which file to use

Name

experiment.m

experiment_better_version.m

experiment_final.m

experiment_final_final_20161007...

experiment_maybe_better_2016...

A basic example

- Only one person can work on a file at a time
- Difficult to keep track on which file to use
- Difficult to compare the files

Name

experiment.m

experiment_better_version.m

experiment_final.m

experiment_final_final_20161007...

experiment_maybe_better_2016...

A basic example

- Only one person can work on a file at a time
- Difficult to keep track on which file to use
- Difficult to compare the files
- Do you have back up?

Name

experiment.m

experiment_better_version.m

experiment_final.m

experiment_final_final_20161007...

experiment_maybe_better_2016...

A basic example

- Only one person can work on a file at a time
- Difficult to keep track on which file to use
- Difficult to compare the files
- Do you have back up?
- Probably more issues

Name

experiment.m

experiment_better_version.m

experiment_final.m

experiment_maybe_better_2016...

Smarter way of doing it

- Equivalent of storing your stuff on M

Smarter way of doing it

- Equivalent of storing your stuff on M
- Included in MAC

Smarter way of doing it

- Equivalent of storing your stuff on M
- Included in MAC
- Easy to set up

Smarter way of doing it

- Equivalent of storing your stuff on M
- Included in MAC
- Easy to set up
- Still difficult to collaborate

Centralized version control

— Examples:

Centralized version control

- Examples:
 - CVS

Centralized version control

— Examples:

- CVS
- subversion

Centralized version control

— Examples:

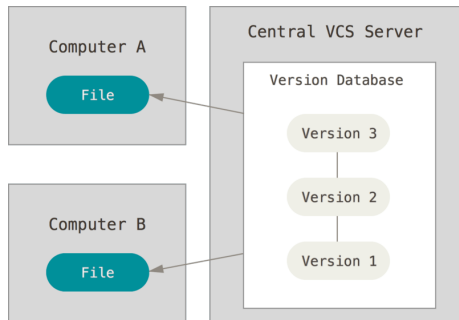

- CVS
- subversion
- perforce

Centralized version control

- Examples:
 - CVS
 - subversion
 - perforce
- Easy to collaborate

Centralized version control

- Examples:
 - CVS
 - subversion
 - perforce
- Easy to collaborate
- Check out specific versions

Centralized version control

- Examples:
 - CVS
 - subversion
 - perforce
- Easy to collaborate
- Check out specific versions
- Single point of failure (N-0)

Centralized version control

- Examples:
 - CVS
 - subversion
 - perforce
- Easy to collaborate
- Check out specific versions
- Single point of failure (N-0)
- If the server dies only checked out versions can be saved

Distributed version control

— Examples:

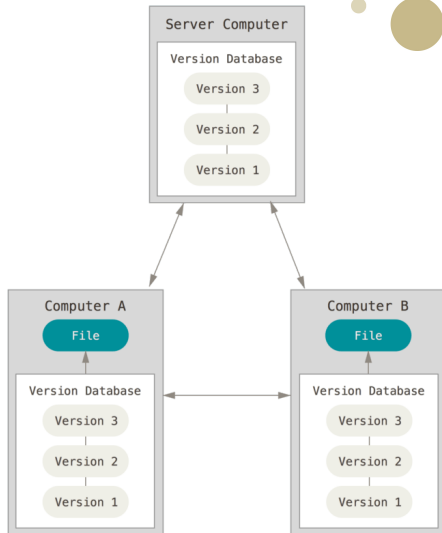

Distributed version control

— Examples:

- Git

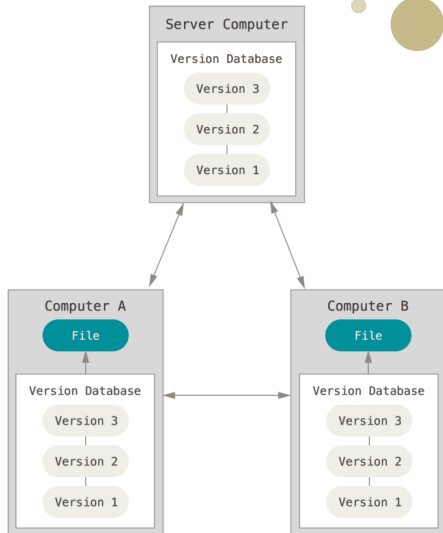

Distributed version control

— Examples:

- Git
- Mercurial

Distributed version control

— Examples:

- Git
- Mercurial
- Bazaar

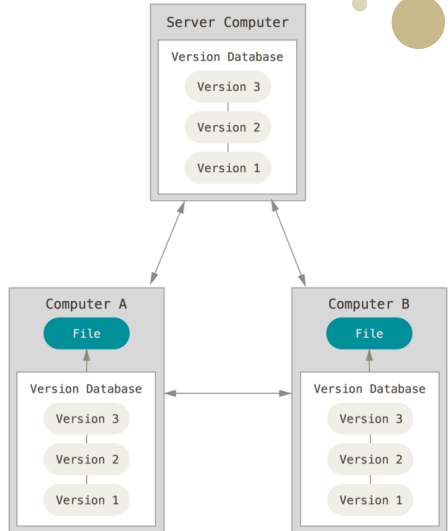

Distributed version control

— Examples:

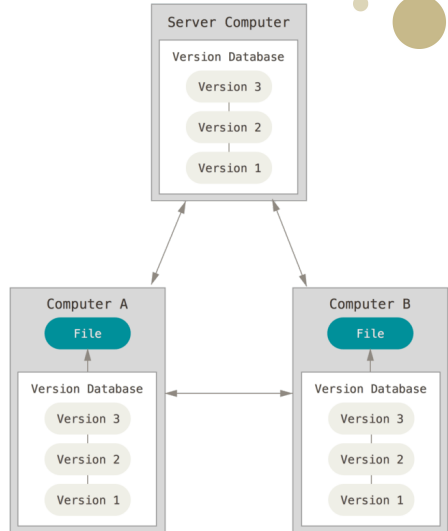

- Git
- Mercurial
- Bazaar
- Darcs

Distributed version control

- Examples:
 - Git
 - Mercurial
 - Bazaar
 - Darcs
- Same advantages as centralized version control

Distributed version control

- Examples:
 - Git
 - Mercurial
 - Bazaar
 - Darcs
- Same advantages as centralized version control
- All users can reconstruct the project

Distributed version control

- Examples:
 - Git
 - Mercurial
 - Bazaar
 - Darcs
- Same advantages as centralized version control
- All users can reconstruct the project
- Easy to work against multiple servers

Should you use version control?

— Do you write code?

Dont do this:

```
% Read data set 1
data=read_data('data1.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

```
% Read data set 1
data=read_data('data2.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

Should you use version control?

- Do you write code?
 - If yes: use version control

Dont do this:

```
% Read data set 1
data=read_data('data1.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

```
% Read data set 1
data=read_data('data2.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

Should you use version control?

- Do you write code?
 - If yes: use version control
- Never copy code --+

Dont do this:

```
% Read data set 1
data=read_data('data1.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

```
% Read data set 1
data=read_data('data2.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

Should you use version control?

- Do you write code?
 - If yes: use version control
- Never copy code --+
- Write functions and keep them version controlled

Dont do this:

```
% Read data set 1
data=read_data('data1.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

```
% Read data set 1
data=read_data('data2.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

Should you use version control?

- Do you write code?
 - If yes: use version control
- Never copy code --+
- Write functions and keep them version controlled
- Remember code is a virtual laboratory

Dont do this:

```
% Read data set 1
data=read_data('data1.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

```
% Read data set 1
data=read_data('data2.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

Should you use version control?

- Do you write code?
 - If yes: use version control
- Never copy code --+
- Write functions and keep them version controlled
- Remember code is a virtual laboratory
- Versions can for instance be tagged with name of publication(reproducibility for review)

Dont do this:

```
% Read data set 1
data=read_data('data1.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

```
% Read data set 1
data=read_data('data2.csv'
               ');
df = process_data(data,
                  0.02, 1);
plot(df);
```

Creating a git repository

— New repository button

Creating a git repository

- New repository button
- Create the name

Create a new repository

A repository contains all the files for your project, including the revision history.

Owner

Hofsmo

Repository name

Example

Great repository names are short and memorable. Need inspiration? How about **studious-engine**.

Description (optional)

Public

Anyone can see this repository. You choose who can commit.

Private

You choose who can see and commit to this repository.

Initialize this repository with a README

This will let you immediately clone the repository to your computer. Skip this step if you're importing an existing repository.

Add .gitignore: **None**

Add a license: **None**

Create repository

Creating a git repository

- New repository button
- Create the name
- Create a description

Create a new repository

A repository contains all the files for your project, including the revision history.

Owner

Hofsmo

Repository name

Example

Great repository names are short and memorable. Need inspiration? How about **studious-engine**.

Description (optional)

Example repository created for the friday colloquium at NTNU

Public

Anyone can see this repository. You choose who can commit.

Private

You choose who can see and commit to this repository.

☐ **Initialize this repository with a README**

This will let you immediately clone the repository to your computer. Skip this step if you're importing an existing repository.

Add .gitignore: **None**

Add a license: **None**

 - Decide where to put it and clone

File we want to control

```
def preprocess_data(signal, window=100, detrend=True):  
    """Function that preprocesses some data.  
    This functions preprocesses a signal by detrending it  
    and then applying a moving average filter.  
    Args:  
        signal: Input signal  
        window: Window size used for the moving average filter  
        detrend: Whether or not to detrend the signal  
    Output:  
        processed: The preprocessed signal  
    """  
    # Detrend the signal  
    if detrend:  
        signal = sig.detrend  
  
    # Apply a moving average filter using convolution  
    window = np.ones(window)/float(window)  
    return np.convolve(signal, window, 'same')
```

Staging our first file

```
~/P/G/Example (master|...) $ git status
On branch master
Your branch is up-to-date with 'origin/master'.
Untracked files:
  (use "git add <file>..." to include in what will be committed)

        example/

nothing added to commit but untracked files present (use "git add" to track)
```

— In the terminal

Staging our first file

```
~/P/G/Example (master|...) $ git status
On branch master
Your branch is up-to-date with 'origin/master'.
Untracked files:
  (use "git add <file>..." to include in what will be committed)

        example/

nothing added to commit but untracked files present (use "git add" to track)
```

- In the terminal
 - git status

Staging our first file

```
~/P/G/Example (master|...) $ git add example/preprocess_data.py  
~/P/G/Example (master|●...) $
```

— In the terminal

- git status
- stage file using
git add

Staging our first file

- In the terminal
 - git status
 - stage file using git add
- In the GUI

Staging our first file

- In the terminal
 - `git status`
 - stage file using `git add`
- In the GUI
 - Push "Stage File" button

Ignoring editor generated file

- Remember the second file?

```
On branch master
Your branch is up-to-date with 'origin/master'.
Changes to be committed:
  (use "git reset HEAD <file>..." to unstage)

    new file:   example/preprocess_data.py

Untracked files:
  (use "git add <file>..." to include in what will be committed)

    example/.preprocess_data.py.swp
```

Ignoring editor generated file

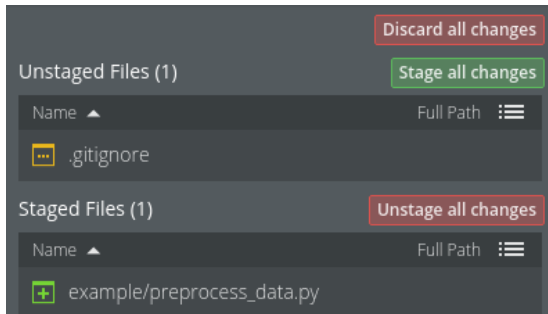

- Remember the second file?
- Tell git to ignore it

```
1
2 # Spyder project settings
3 .spyderproject
4
5 # Rope project settings
6 .ropeproject
7
8 # Ignore vim stuff
9 *.swp
10 *.swp
NORMAL > master > .gitignore
```

Ignoring editor generated file

- Remember the second file?
- Tell git to ignore it
- Git ignores it

Ignoring editor generated file

```
~/P/G/Example (master|🍌🔑) $ git add .gitignore
```

- Remember the second file?
- Tell git to ignore it
- Git ignores it
- Stage the modified .gitignore

Our first commit

— In terminal:

```
On branch master
Your branch is up-to-date with 'origin/master'.
Changes to be committed:
  (use "git reset HEAD <file>..." to unstage)

        modified:   .gitignore
        new file:   example/preprocess_data.py
```

Our first commit

— In terminal:

- Enter git commit

```
~/P/G/Example (master|●) $ git commit
```

Our first commit

— In terminal:

- Enter git commit
- Write and save commit message

```
2 # Please enter the commit message for your changes. Lines starting
3 # with '#' will be ignored, and an empty message aborts the commit.
4 On branch master
5 Your branch is up-to-date with 'origin/master'.
6
7 Changes to be committed:
8   modified:   .gitignore
9   Added swp and swo to gitignore
10  new file:   example/preprocess_data.py
11  First implementation of function
```

Our first commit

- In terminal:
 - Enter git commit
 - Write and save commit message
- In GUI:

Our first commit

- In terminal:
 - Enter git commit
 - Write and save commit message
- In GUI:
 - Write commit message

A screenshot of a 'Commit Message' dialog box. The title bar is dark gray with the text 'Commit Message' and a small square icon followed by the word 'Amend'. The main area is a dark gray text input field containing the text 'First implementation of preprocess_data and mod' and the placeholder text 'Description' below it. At the bottom is a green button with the text 'Commit'.

Our first commit

- In terminal:
 - Enter `git commit`
 - Write and save commit message
- In GUI:
 - Write commit message
 - Push commit button

A screenshot of a 'Commit Message' dialog box. The title bar is dark gray with the text 'Commit Message' and a small square icon followed by the word 'Amend'. The main area is a dark gray text input field containing the text 'First implementation of preprocess_data and mod' and the placeholder text 'Description' below it. At the bottom, there is a large green button with the word 'Commit' in white text.

Push the changes to GitHub

- GitHub (remote) is now behind our local copy

Push the changes to GitHub

- GitHub (remote) is now behind our local copy
- Push changes to GitHub

```
~/P/G/Example (master|●) $ git push origin master
```

Where to push

What to push

Push the changes to GitHub

- GitHub (remote) is now behind our local copy
- Push changes to GitHub
- GitHub and local copy are now equal

 1. Create issue
 2. Create issue branch
 3. Work on issue branch until it works
 4. Create a pull request
 5. Merge issue branch to develop

Introducing a git work flow

- Working directly on the master branch is not recommended
- In this section I will present a git flow inspired working flow I use at SINTEF:
 1. Create issue
 2. Create issue branch
 3. Work on issue branch until it works
 4. Create a pull request
 5. Merge issue branch to develop
 6. When develop is stable merge into master

Introducing a git work flow

- Working directly on the master branch is not recommended
- In this section I will present a git flow inspired working flow I use at SINTEF:
 1. Create issue
 2. Create issue branch
 3. Work on issue branch until it works
 4. Create a pull request
 5. Merge issue branch to develop
 6. When develop is stable merge into master
- Example will follow

Hi,
It would be nice if the function also decimated the signal.

Hofsmo added the **enhancement** label a minute ago

Hofsmo self-assigned this a minute ago

Create the feature branches

- Branch the develop branch from master

```
~/P/G/Example (master|✓) $ git checkout -b develop  
Switched to a new branch 'develop'  
~/P/G/Example (develop|✓) $
```

Create the feature branches

- Branch the develop branch from master
- Develop and master point to the same commit

Create the feature branches

- Branch the develop branch from master
- Develop and master point to the same commit
- Branch the feature branch from develop

- Create the pull request
- Delete the branch

On GH-1 added decimate: #2

The screenshot shows a GitHub pull request interface. At the top, a purple 'Merged' badge is followed by the text 'Hofsmo merged 1 commit into develop from feature/decimate-gh1 3 minutes ago'. Below this, a summary bar shows 'Conversation 0', 'Commits 1', and 'Files changed 1'. The main content area includes a comment from 'Hofsmo' 5 minutes ago: 'Use scipy.signal.decimate to decimate the signal. The filtering is also done by this function now.' Below the comment is a commit history section showing 'On GH-1 added decimate: ...' by 'Ba09eed'. Further down, a message states 'Hofsmo merged commit 61dfe82 into develop 3 minutes ago' with a 'Revert' button. A light blue informational box with a lightbulb icon says 'Avoid bugs by automatically running your tests.' and provides a 'Learn more' link. At the bottom, a purple box with a checkmark icon states 'Pull request successfully merged and closed' and 'You're all set—the feature/decimate- branch can be safely deleted.' To the right of this box is a 'Delete branch' button, which is highlighted by a black arrow pointing down to it.

Create pull request

- Create a pull request
- Choose develop as base
- Create the pull request
- Delete the branch
- Close the issue (Could also have written "close GH-1" earlier to do this)
